PROJECT EXPERIENCE

GRAND TETON NATIONAL PARK TRANSPORTATION STUDY

GRAND TETON NATIONAL PARK , WYOMING (COMPLETED)

Charlier Associates conducted a transportation study for Grand Teton National Park to identify policies, programs, projects and future planning activities to ensure consistency between the transportation system and the Park's overall goals for visitor experience, resource management, and environmental preservation. Key elements of the study included:

- *Description and analysis of current conditions (i.e., land uses, visitation, travel patterns, traffic, parking, transportation services, and transportation infrastructure).*
- *Forecast of future conditions.*
- *Assessment of transportation, land use, economic and other decision-making processes occurring outside Grand Teton's boundaries, but having an impact on the Park.*
- *Identification of transportation facilities, services and other resources needed to achieve the Park's mission and long-term goals.*
- *Evaluation of the Park's operations and management processes affecting or relating to transportation.*

The study process included coordination with a Project Working Group consisting of a variety of local agencies, regional agencies, and other key stakeholders (e.g., environmental organizations, chamber of commerce, concessionaires, etc.). The process also included a series of evening public workshops to obtain ideas and input from the general public.
