# Sustainable Mobility

- Why LEED ND is so important -

# CLASSIC SUSTAINABILITY

---

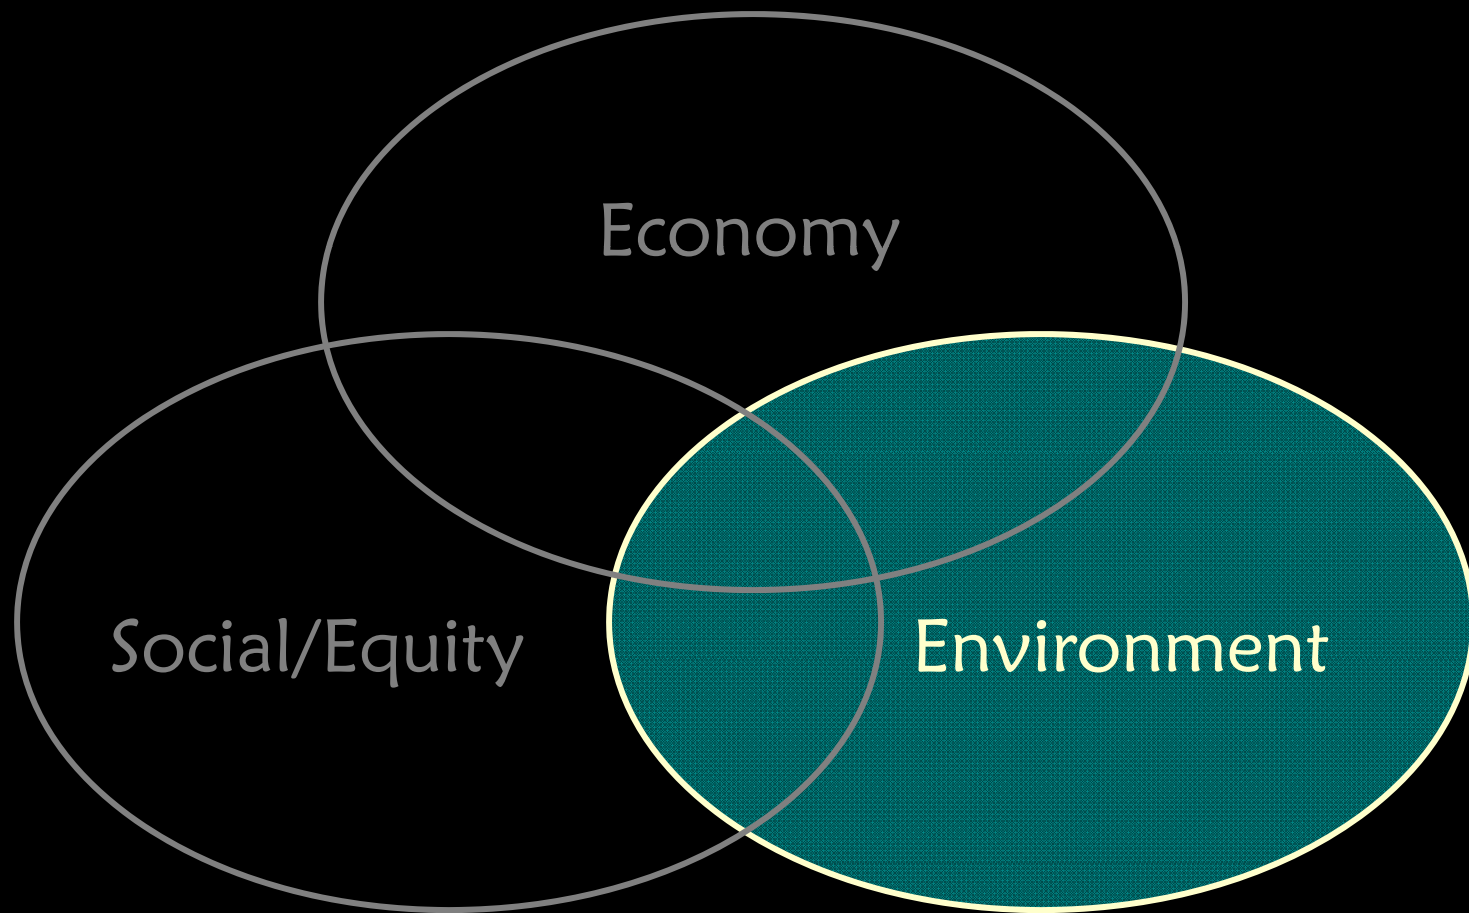

# Sustainability Defined

---

*How can we meet the  
needs of today while  
allowing future generations  
to meet their needs?*

# Impacts

---

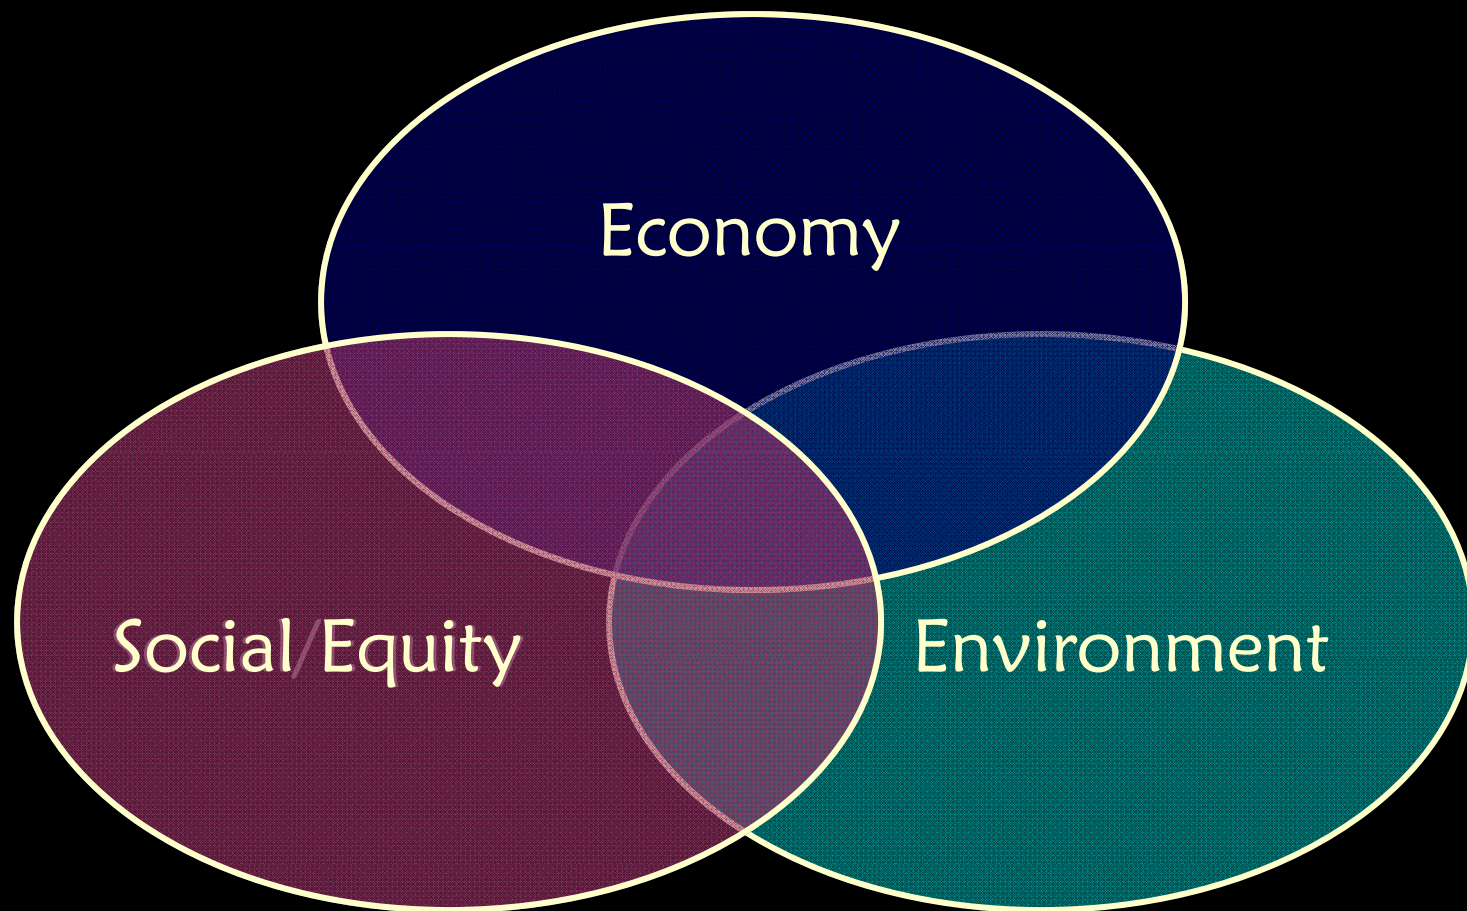

# Overview: Climate Change

---

- Greenhouse gases associated with human activities are contributing to global warming with potentially serious consequences
- Emerging U.S. policy:
  - Limit temperature increase to no more than 2° to 3° Centigrade
  - Cut greenhouse gas emissions by 60% to 80% below 1990 levels by 2050

# Impacts

---

# Climate Change Goal

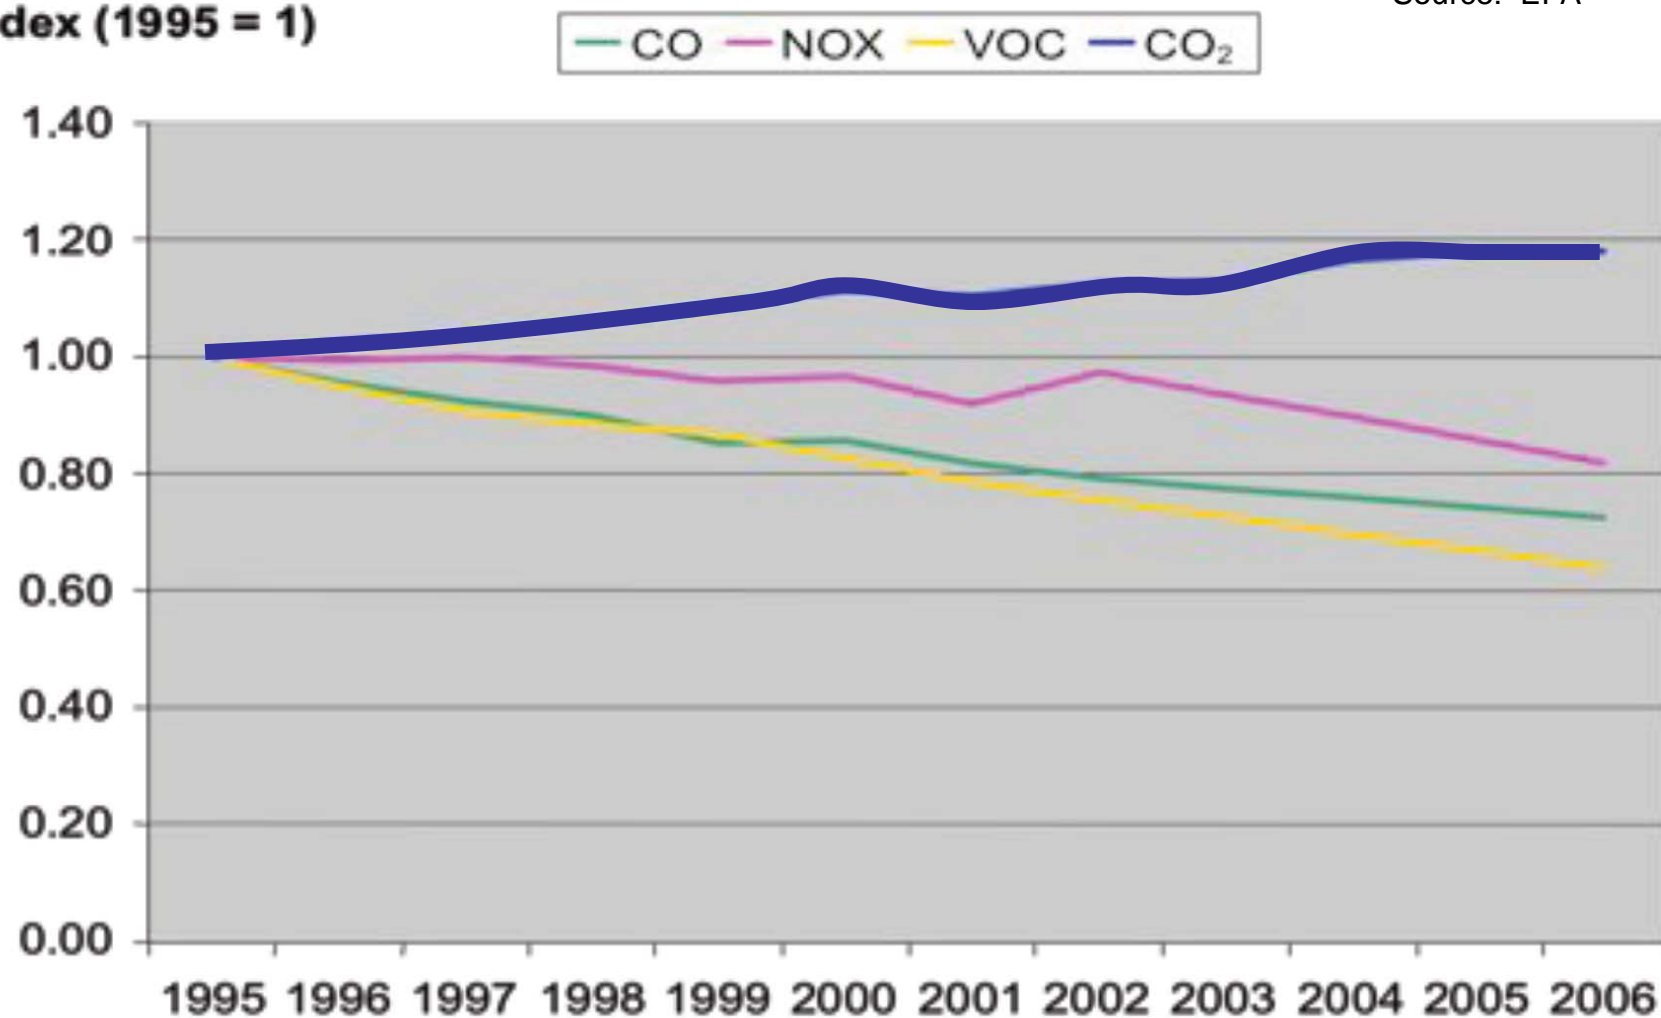

---

- *Cut GHG emissions by 60% to 80% below 1990 levels by 2050*

# U.S. Transportation Emissions

# Technology Alone Cannot Solve the Problem

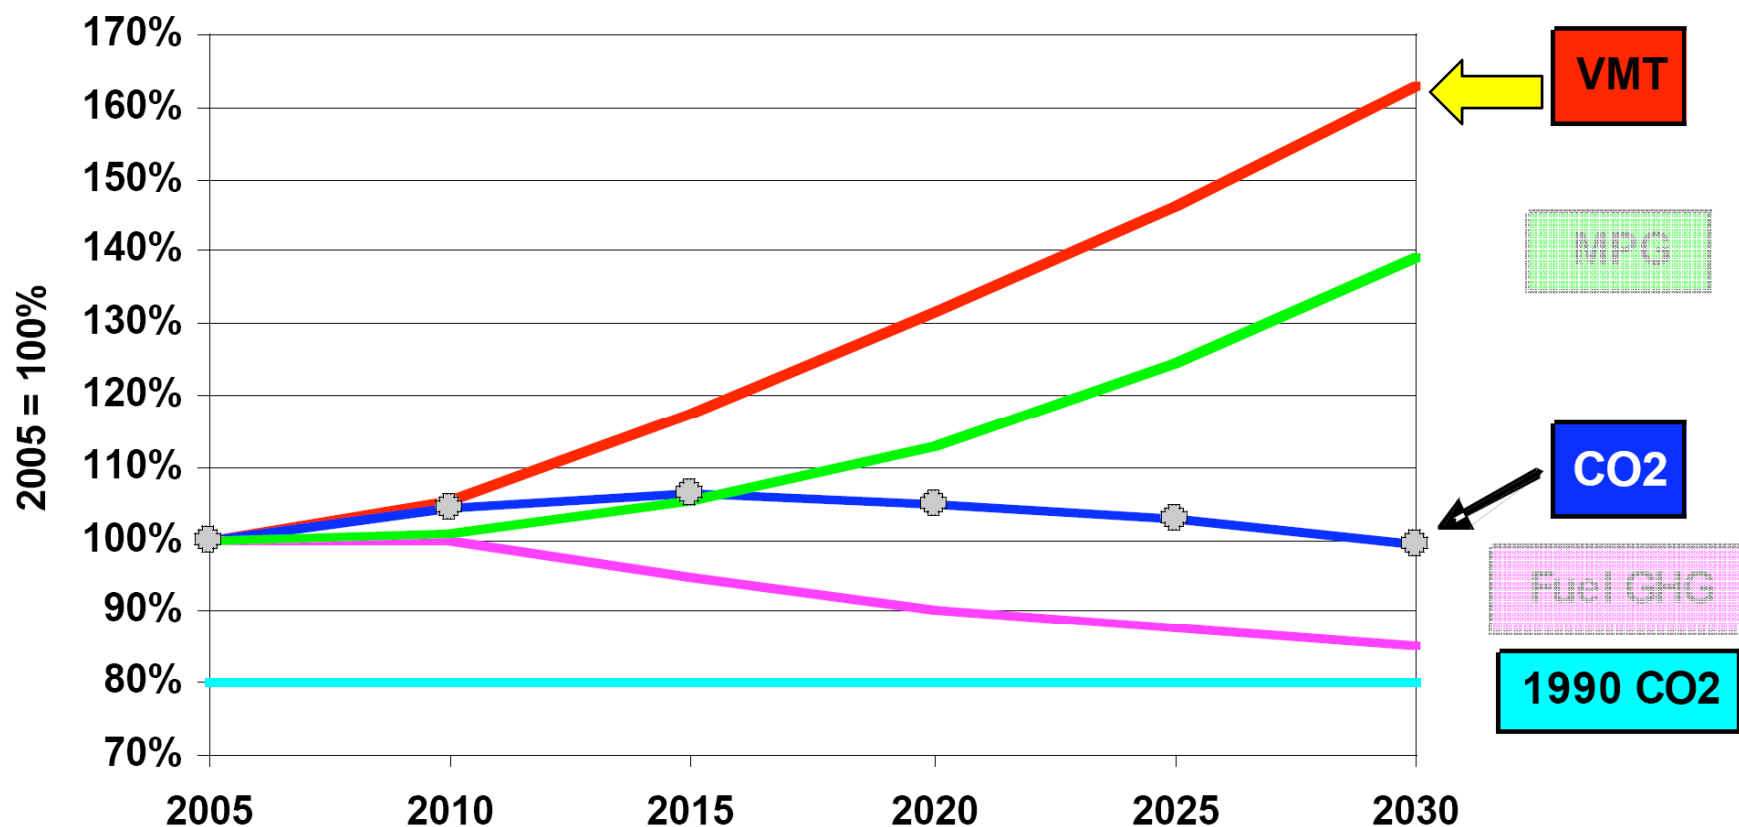

## PROJECTED GROWTH IN CO<sub>2</sub> EMISSIONS FROM CARS AND LIGHT TRUCKS ASSUMING STRINGENT NATIONWIDE VEHICLE AND FUEL STANDARDS\*

\*WITH SENATE CAFE LEVELS -- NEW PASSENGER VEHICLE FUEL ECONOMY OF 35 MPG IN 2020  
AND CALIFORNIA LOW CARBON FUEL STANDARD OF -10% IN 2020 APPLIED NATIONALLY.

Sources: VMT: EIA with 10% rebound MPG: US Senate, Fuels: C.

# ...Even With Very Stringent Standards

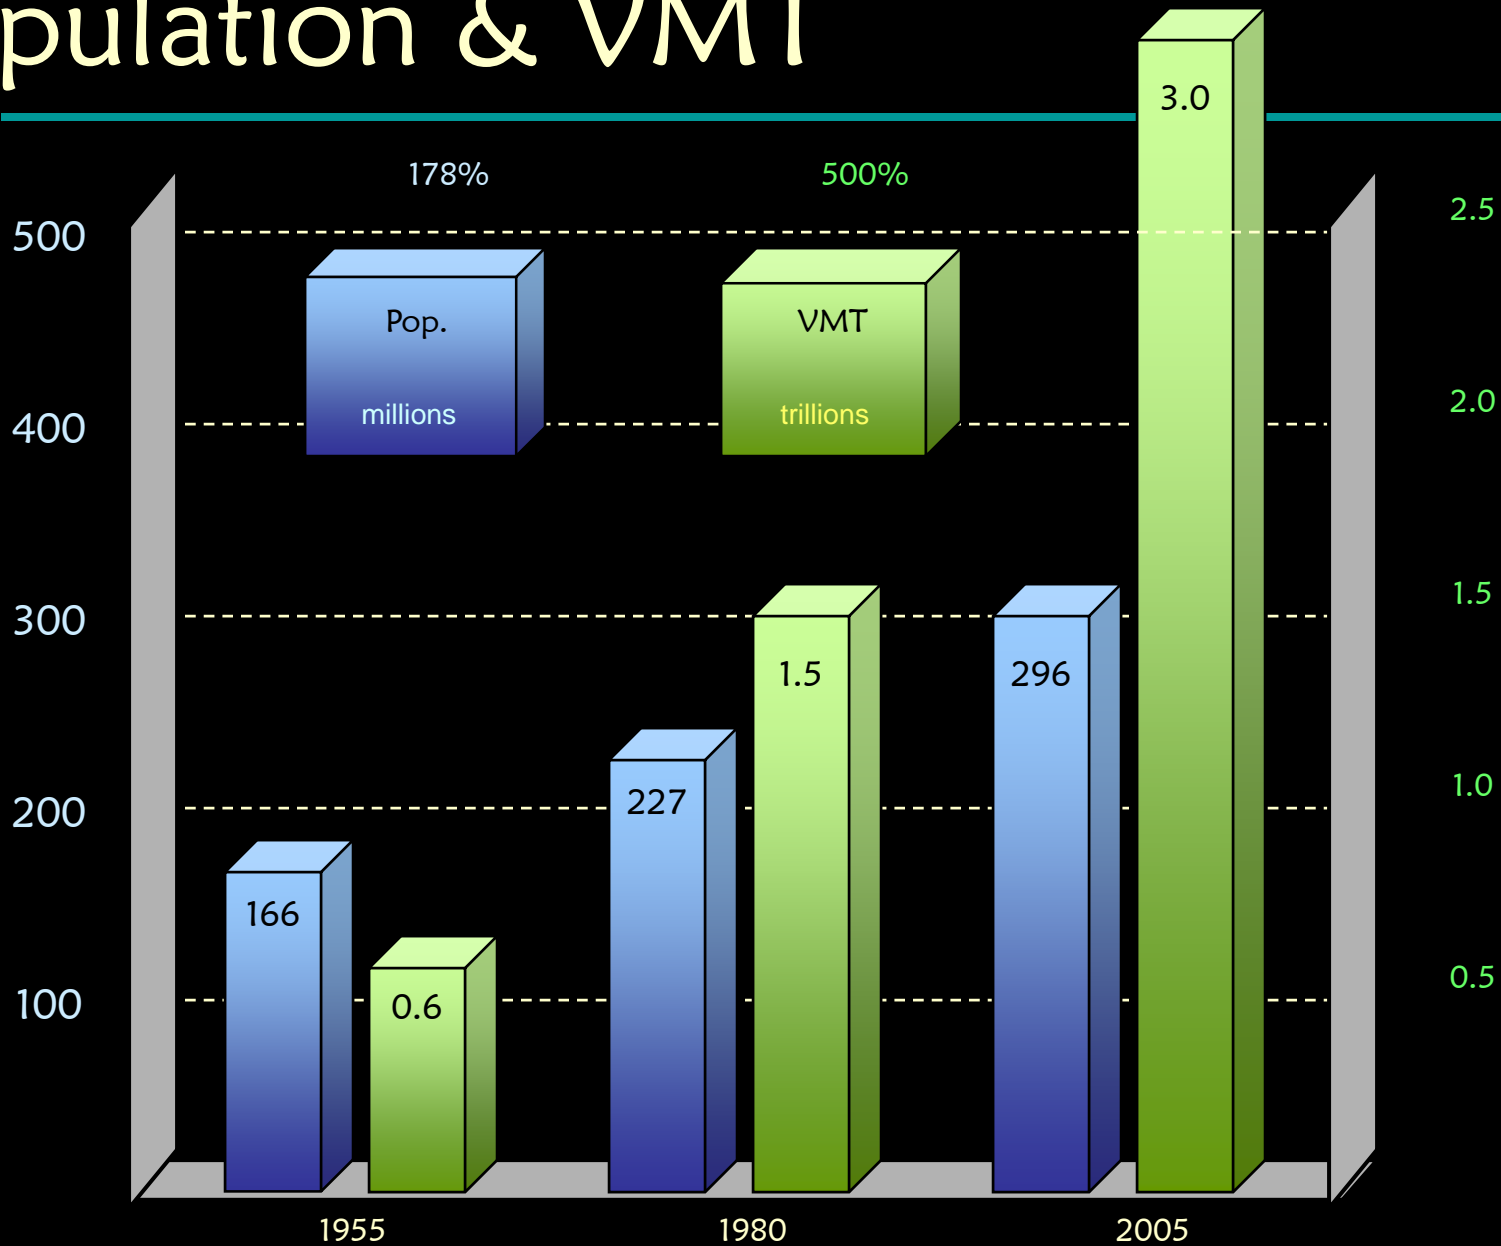

Sources: VMT: EIA with 10% rebound, MPG & Fuel: Trend Extrapolation

United States

# Population & VMT

# Supply-Side Failure

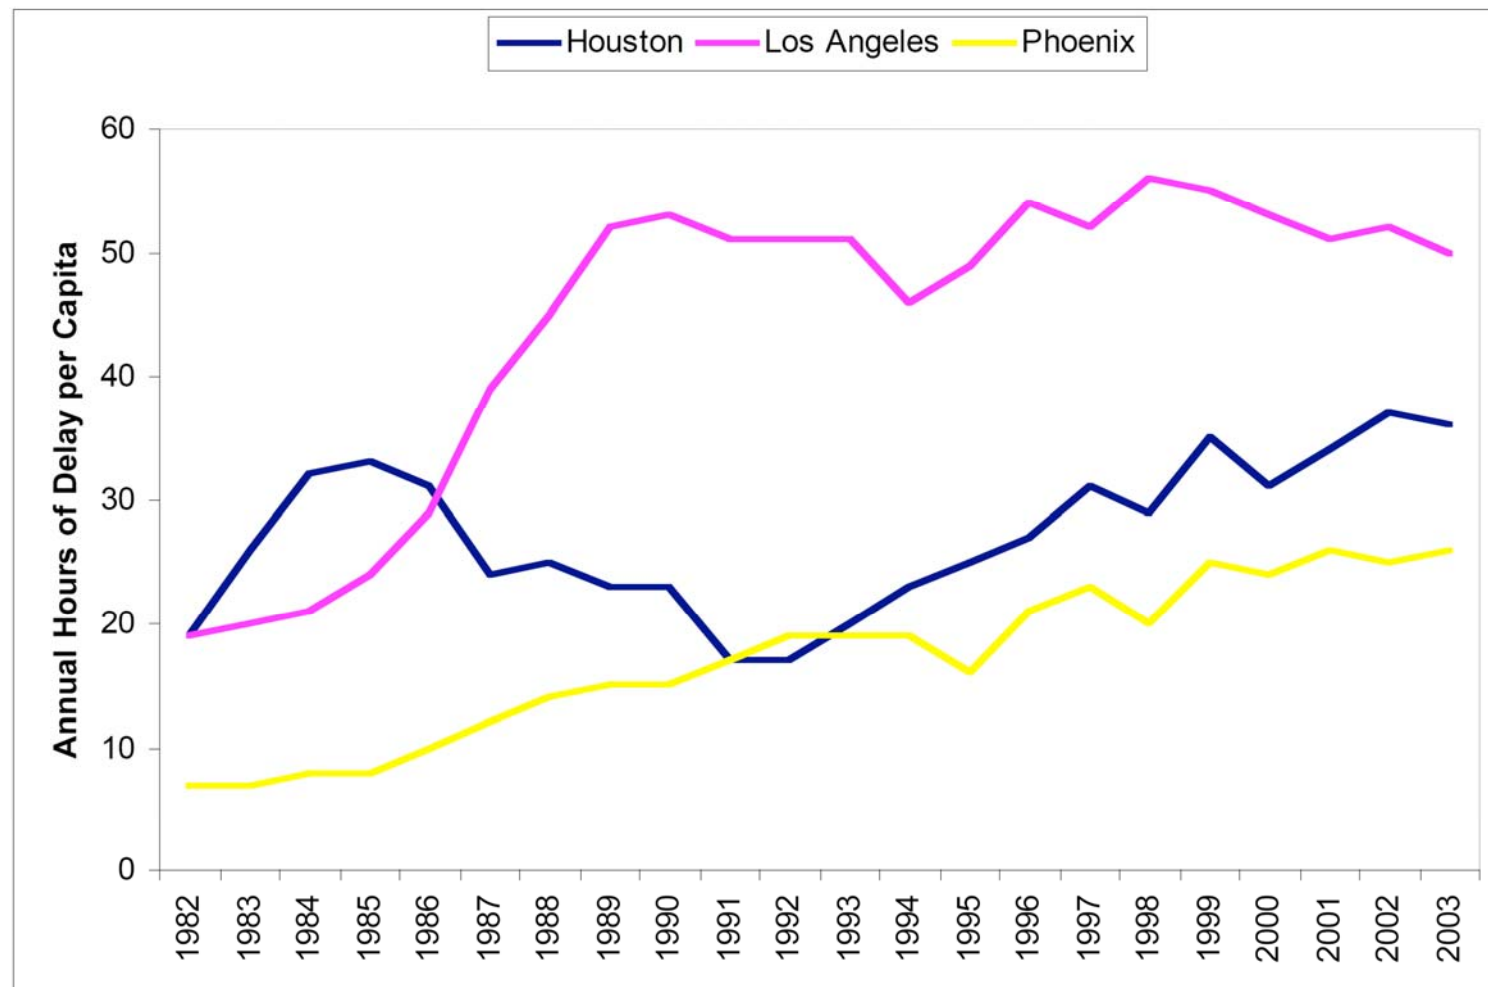

---

- VMT has grown twice as fast as highway capacity in the nation's urbanized areas
- Highway building itself induces more traffic, induces low efficiency development patterns and accelerates CO<sub>2</sub> emissions

# Road Building Has Not Reduced Delay

**Figure 1-6 Growth of Annual Hours of Delay per Capita**

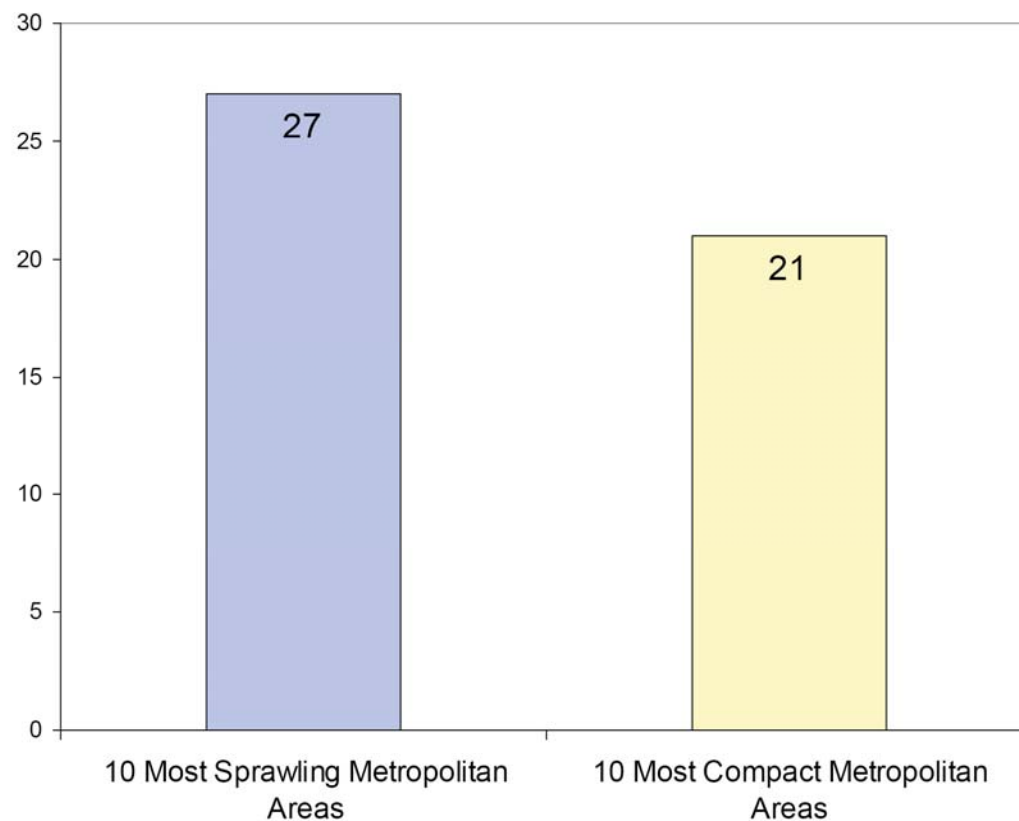

*Source: Schrank and Lomax 2005.*

# Urban Design & VMT

FIGURE O-5

AVERAGE DAILY VEHICLE MILES TRAVELED

SOURCE: EWING, PENDALL, AND CHEN 2002, P. 18.

- Compact cities generate less VMT/capita
- The difference (>20%) is more than can be achieved thru either alt. fuels or improved fuel economy

# Research Findings 1

---

- No significant correlation between high density/mixed use development and congestion or delay
- Sprawl does not consistently increase or reduce congestion
- Land use mix alone can account for >20% reduction in VMT/household

## Research Findings 2

---

- Higher gross density reduces VMT/household (big cities and smaller towns)
- Connected street networks do not reduce delay, but do reduce VMT/household
- Residents of sprawl areas exhibit lower physical activity, higher levels of obesity and other health problems

# Active Living by Design

### Risk Rings: Exposures

Exposures to behaviors and our environment offer all sorts of risks. Here we present a full spectrum of exposures that caused American deaths - the size of each ring is proportional to the number of deaths from the specified cause.

Use your mouse and click the rings. See the "odds of dying" from any of the exposures presented. The 'odds of dying' is reported here as the number of people expected to produce one death from a particular cause. This number is calculated by dividing the United States population, approximately 300 million people, by the number of deaths from each cause during 2002. Using this method, 771 people would be expected to yield one death from active smoking. In contrast, 5,882,353 Americans would yield one death from exposure to the dry cleaning chemical, perchloroethylene.

Active Smoking was the leading cause of exposure death. In contrast, exposure to the dry-cleaning fluid, perchloroethylene and to numerous environmental chemicals- resulted in virtually no deaths at all.

[Home Page](#)[Riskometer](#)[Risk Rings](#)[Data](#)

**Adult  
Obesity**

Odds of Dying:  
1 in 2,681

*Obesity due to  
Dietary Practices:  
1 in 3,570*

*Obesity due to  
Sedentary Lifestyle:  
1 in 10,767*

Deaths that are a consequence of obesity likely represent the second largest number of deaths produced by preventable risk factors.

The exact number of deaths attributable to obesity is impossible to measure directly because the condition of obesity is seldom listed as an underlying cause of death - thus the figures presented here are an estimate that will surely change as more data are accumulated.

Deaths that are a consequence of obesity frequently result from an array of diseases associated with obesity (including cardiovascular disease, cancer, respiratory disease, stroke, and diabetes, among others), although each of these causes of death can exist without obesity.

# Obesity Trends Among U.S. Adults between 1985 and 2007

---

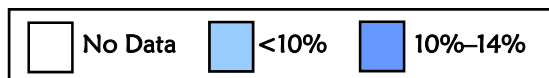

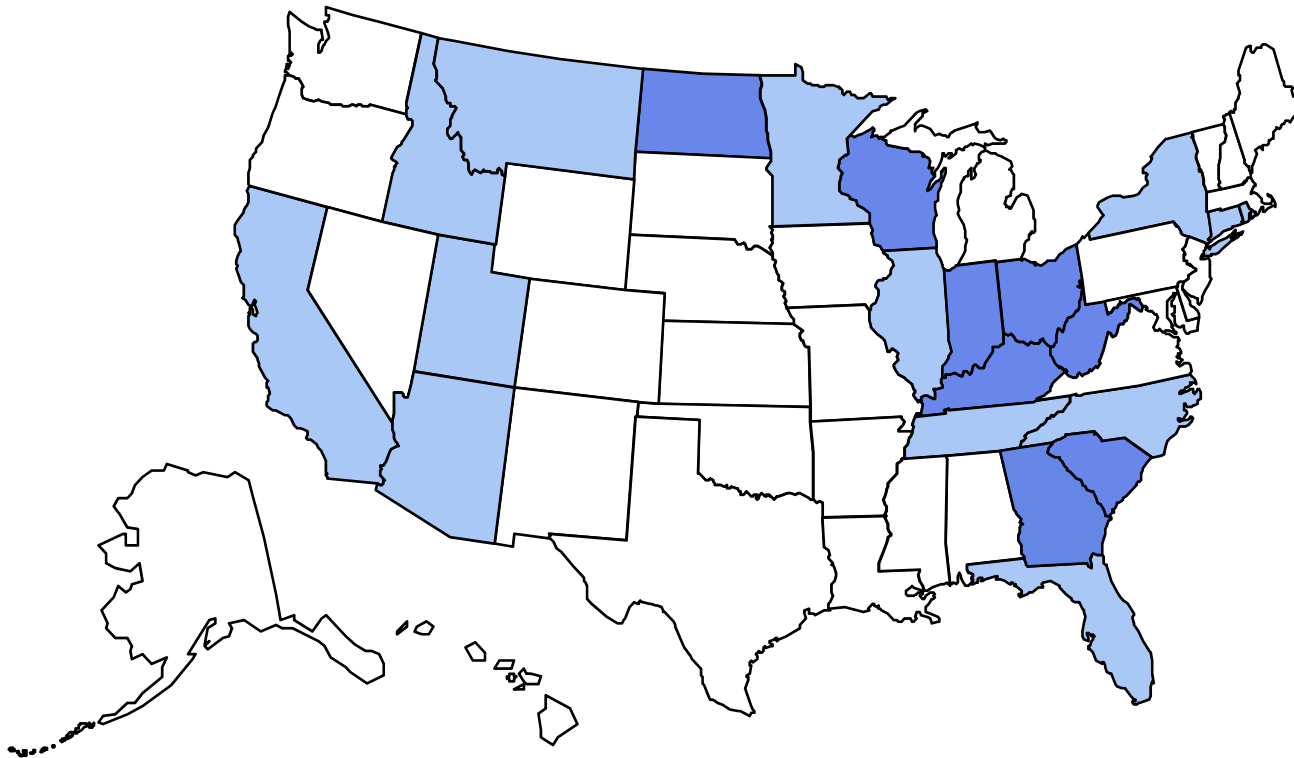

## *Definitions:*

- Obesity: Having a very high amount of body fat in relation to lean body mass, or Body Mass Index (BMI) of 30 or higher.
- Body Mass Index (BMI): A measure of an adult's weight in relation to his or her height, specifically the adult's weight in kilograms divided by the square of his or her height in meters.

## Obesity Trends\* Among U.S. Adults

**Risk Rings:**

**Leading Causes of Death**

Diseases and injuries cost the lives of hundreds of thousands of Americans each year. Here, we present the 15 leading causes of death - both diseases and injuries are represented.

Use your mouse and click the rings. See the "odds of dying" from any of the diseases or injuries presented. The 'odds of dying' is reported here as the number of people expected to produce one death from a particular cause. This number is calculated by dividing the United States population, approximately 300 million people, by the number of deaths from each cause during 2002. Using this method, 771 people would be expected to yield one death from active smoking. In contrast, 5,882,353 Americans would yield one death from exposure to the dry cleaning chemical, perchloroethylene.
